# E-Commerce Supply Chain Analysis

By: Sampurna Dey

Linkedin: www.linkedin.com/in/sampurna-dey-060573129

Github: <a href="https://github.com/sampurna-project">https://github.com/sampurna-project</a>

## - Objective:

- 1. To find the revenue generated by different product type.
- 2. To analyze the sales by product type.
- 3. To find out the total revenue generated from shipping carriers.
- 4. To analyze revenue generated by each SKU (Stock Keeping Unit).
- 5. To analyze the shupping cost of carriers.
- 6. To find out the cost distribution by transportation modes.
- 7. To analyze the defect rate of the product during shipping.

```
#Importing Libraries
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns

#Importing Data
Supplychain = pd.read_csv("/content/supply_chain_data.csv")
Supplychain
```

	Product type	SKU	Price	Availability	Number of products sold	Revenue generated	Customer demographics
0	haircare	SKU0	69.808006	55	802	8661.996792	Non-binary

Product type 0 0 Price Availability 0 Number of products sold Revenue generated 0 Customer demographics 0 Stock levels 0 Lead times Order quantities Shipping times 0 Shipping carriers 0 Shipping costs Supplier name 0 Location 0 Lead time 0 Production volumes Manufacturing lead time Manufacturing costs 0 Inspection results 0 Defect rates 0 Transportation modes 0 0 Routes 0 Costs dtype: int64

```
#Creating a Visualization on Price of Products and Revenue Generated by them:

plt.figure(figsize = (10,10))
sns.lmplot(x='Price', y='Revenue generated', data=Supplychain, hue='Product type', ci=None, palette = 'magma')
plt.title("Price of Products and Revenue Generated", fontweight = 'bold')
plt.show()
```

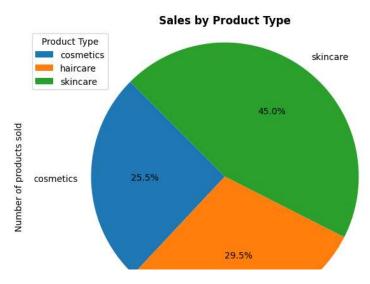

#### - Conclusion:

Skincare products contribute significantly to the company's revenue, being the primary source

while cosmetics and haircare products generate comparatively lower revenue.

```
# Grouping the DataFrame by 'Product type' and calculate the sum of 'Number of products sold'
sales_data = Supplychain.groupby('Product type')['Number of products sold'].sum()
print(sales_data)
     Product type
     cosmetics
                 11757
     haircare
                  13611
                  20731
     Name: Number of products sold, dtype: int64
#Creating Visualization Based on Sales Data
plt.figure(figsize = (8,6))
sales_data.plot(kind='pie', autopct='%0.1f%%', startangle = 135)
plt.axis('equal')
plt.legend(sales_data.index , title='Product Type', loc='upper left')
plt.title("Sales by Product Type", fontweight = 'bold')
plt.show()
```

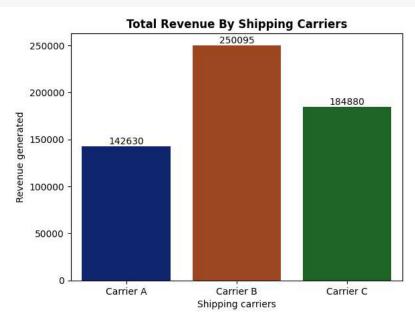

## → Conclusion :

Skincare leads the sales charts, with haircare following closely in second place and cosmetics claiming the last spot in terms of revenue generation.

Supplychain.head()

	Product type	SKU	Price	Availability	Number of products sold	Revenue generated	Customer demographics	S <sup>.</sup> le
0	haircare	SKU0	69.808006	55	802	8661.996792	Non-binary	
1	skincare	SKU1	14.843523	95	736	7460.900065	Female	
2	haircare	SKU2	11.319683	34	8	9577.749626	Unknown	
3	skincare	SKU3	61.163343	68	83	7766.836426	Non-binary	
4	skincare	SKU4	4.805496	26	871	2686.505152	Non-binary

```
#Groupby operation for calculating the sum of the "Revenue generated" for each "Shipping carriers"
total_revenue = Supplychain.groupby('Shipping carriers')['Revenue generated'].sum().reset_index()
print(total_revenue)
      Shipping carriers Revenue generated
     0
              Carrier A
                             142629.994607
    1
              Carrier B
                             250094.646988
     2
              Carrier C
                             184880.177143
#Creating Visualization on Revenue Generated through Shipping Carriers
fig = sns.barplot(x = total_revenue['Shipping carriers'] , y = total_revenue['Revenue generated'], palette = 'dark')
# Add count labels on top of each bar
for bars in fig.containers:
    fig.bar_label(bars)
plt.title("Total Revenue By Shipping Carriers", fontweight = 'bold')
plt.show()
```

### - Conclusion:

Based on the above visualization, we observe that Carrier B generated the highest revenue.

# Following that, Carrier C is ranked second in revenue generation, while Carrier A has the lowest revenue among the three carriers

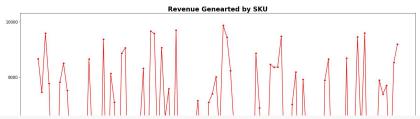

```
#Creating Visualization on Revenue Generated through Shipping Carriers

plt.figure(figsize=(22, 15))
sns.lineplot(x = 'SKU', y = 'Revenue generated', data = Supplychain , marker='o', color='r')

plt.xticks(fontsize = 10, rotation = 90)
plt.yticks(fontsize = 12)

plt.xlabel('SKU', fontsize = 20)
plt.ylabel('Revenue Generated', fontsize = 16)
plt.title('Revenue Generated by SKU', fontsize = 20, fontweight = 'bold')

plt.show()
```

```
#Groupby operation for calculating the sum of the "Shipping costs" for each "Shipping carriers#
shipping_cost = Supplychain.groupby('Shipping carriers')['Shipping costs'].sum().reset_index()
print(shipping_cost)
```

	Shipping carriers	Shipping costs
0	Carrier A	155.537831
1	Carrier B	236.897620
2	Carrier C	162.379457

#Creating Visualization on Shipping Cost through Shipping Carriers

```
fig = sns.barplot(x = shipping_cost['Shipping carriers'] , y = shipping_cost['Shipping costs'], palette = 'dark')
# Add count labels on top of each bar
for bars in fig.containers:
    fig.bar_label(bars)
```

plt.title("Shipping Cost By Shipping Carriers", fontweight = 'bold')
plt.show()

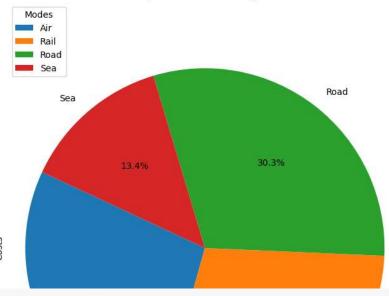

## ▼ Conclusion :

The shipping cost of Carrier B is the highest at 236.898, followed by Carrier C at 162.379, and Carrier A at 155.538.

plt.title("Transportation Costs by Mode", fontweight='bold')
plt.show()
```

#### **Transportation Costs by Mode**

Supplychain.head()

	Product type	SKU	Price	Availability	Number of products sold	Revenue generated	Customer demographics	S <sup>.</sup> le
0	haircare	SKU0	69.808006	55	802	8661.996792	Non-binary	
1	skincare	SKU1	14.843523	95	736	7460.900065	Female	
2	haircare	SKU2	11.319683	34	8	9577.749626	Unknown	
3	skincare	SKU3	61.163343	68	83	7766.836426	Non-binary	
4	skincare	SKU4	4.805496	26	871	2686.505152	Non-binary	
5 r	nws × 24 cc	lumns						•

#Grouping the "Product type" column and then calculating the sum of "Defect rates" for each group
Total\_Defect\_Rates = Supplychain.groupby('Product type')['Defect rates'].sum().reset\_index()
print(Total\_Defect\_Rates)

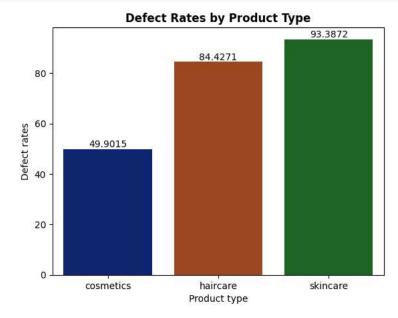

```
Product type Defect rates
0 cosmetics 49.901461
1 haircare 84.427107
2 skincare 93.387231
```

```
#Creating Visualization on Defect Rates by Product Type

fig = sns.barplot(x = Total_Defect_Rates['Product type'] , y = Total_Defect_Rates['Defect rates'], palette = 'dark')

# Add count labels on top of each bar
for bars in fig.containers:
    fig.bar_label(bars)

plt.title("Defect Rates by Product Type", fontweight = 'bold')
plt.show()
```

### Conclusion:

Based on the above visualization, we observe that the defect rate is highest in skincare products,

followed by haircare products in the second position, and cosmetics with the lowest defect rate.
